

BIOL 005B Activity 2: Asexual & sexual reproduction

All organisms come from other organisms, but how exactly? Through this activity, we'll explore some of the modes through which organisms reproduce, their trade-offs, and the limitations of defining such modes.

This activity is meant to be handwritten and completed in class. You will turn this worksheet in at the end of class using the Gradescope app.

1. Fill out the following table using the class's "simulation" data.

Mode of reproduction	# of offspring	# of mutations	# of reproducing individuals	Time to populate
Asexual				
Sexual				

- (a) Based on the data collected, what appear to be the benefits and costs of asexual reproduction?

- (b) Likewise, what are the benefits and costs of sexual reproduction?

2. Use the prompt on the board to answer the following questions.

- (a) What levels of scale may sex be described at in this example?

- (b) What does this example suggest about the linearity of sex determination?

Name:

3. What was something new you learned from this activity? How will you apply what you learned to your future education, profession, or day-to-day life?

That's it for today! Please turn in your worksheet on Gradescope before you go. I've got (bi)nary a doubt that you'll ace this quiz!
